

SECURITY GATEWAY ACCESSES:

At Domfesa we have developed an innovative accessibility system with high technical security features.

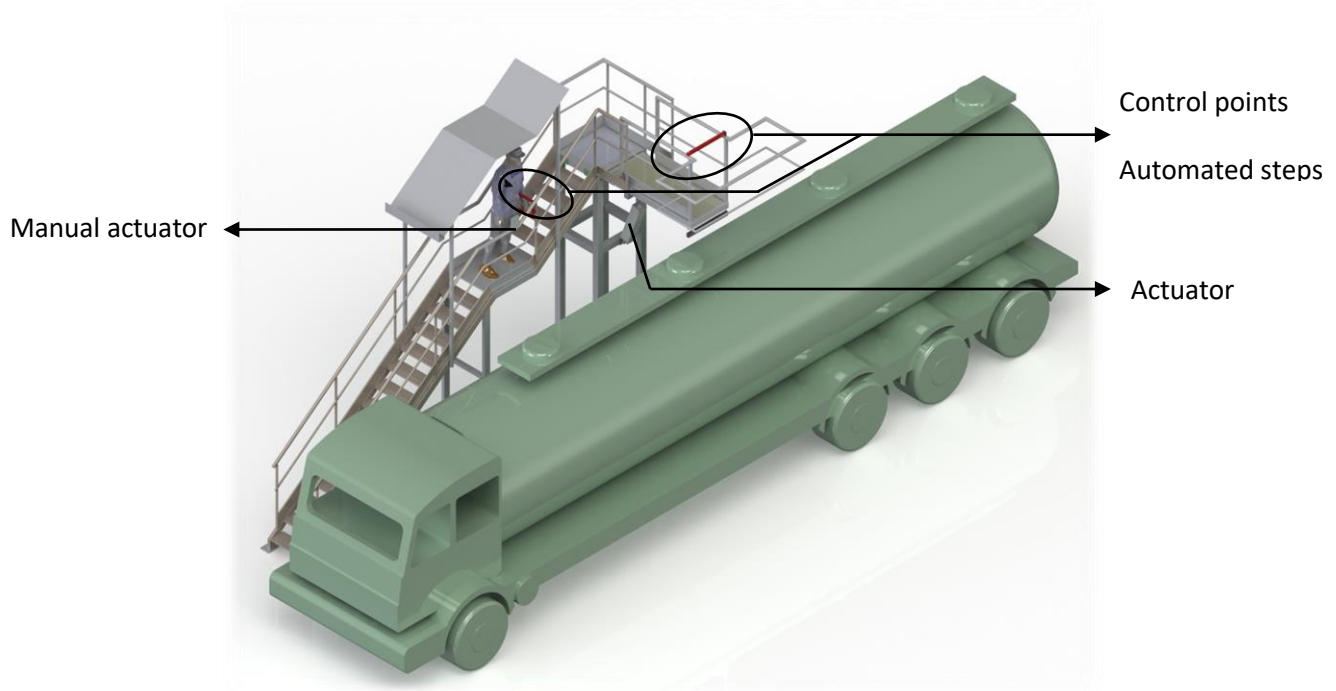

The prevention of occupational risks is fundamental in the industry, which is why our R+D department has designed an access-passage system with a series of electronic devices that guarantee the safety and well-being of the operator who has to carry out an activity in a complex access area at all times.

The security gateway system designed and manufactured by Domfesa provides absolute security, control, functionality and protection.

Following the health and safety regulations stipulated by the EC, the gangway that Domfesa has developed provides the client with a state-of-the-art technological solution that meets the highest requirements of our clients.

With an absolutely versatile design and industrialised manufacture, the gangway system can be adapted to the configurations required in the plant.

The footbridges that Domfesa designs and manufactures are composed of sections limited by firewalls. That is to say, areas where the operator manages the position of the gangway and a complex system of sensors and hydraulic or pneumatic actuators adjust the situation of the gangway until it is safe to move on to the area of operation.

The design consists of control points, as mentioned above, where the operator waits until the sensors and actuators place the walkway in the correct position, thus making the structure's sensors active and enabling the operator to pass to the customer's desired access points.
